

When air quality is bad

Check the pollution level (AQI) at airnow.gov or www2.purpleair.com.

Your home gets filtered fresh air from a central fan serving the whole building. The air filter cleans most pollution, but it may struggle on very hazardous days. If you are concerned about air quality, ask property management how they plan to manage severely hazardous pollution.

When the weather is hot

The device on your wall provides heat and air conditioning, but not fresh air. Take these steps to reduce energy use or stay comfortable if the power goes out. During an outage, contact property management about refrigeration of critical medications and to locate nearby cooling centers
